Various quick hacks to deal wirth fress and fress/imlac
files of various sorts. Source and makefile live in src.
edit the makefile as you wish, then runn it.

Various scripts assume that the output binaries are in your
path.

fress.convert turns a fress binary file into an XML export
containing all the original information. DTD and some test
FRESS files are in fressconv.

trans translates non-standard characters in an ascii print
file from hercules into UTF-8 with appropriate characters.
the tn-chain file works for mainframs programs like fress that
assumed the TN printer chain would be mounted on the line
printer. At some point we will also implement the ALA character
set, which was known as the ALX print train at Brown.

A separately modified version of the Unix utility paps can be
used to turn the UTF-8 results into a PDF file.
